

Flutter Basics

First Screens Development

A clean implementation of a Flutter application with Splash, Login, Sign Up and Home UI screens.

Project	My First Flutter Project
Platform	Flutter / Android
IDE	Visual Studio Code
Repository	github.com/29mayalinakhan2007-hue/my.flutter.project

Submitted Project Report

1. Introduction

This project was created to learn the fundamentals of Flutter and to build the first user-interface screens of a mobile application. The implementation focuses on a clean screen flow and the basic Flutter widgets used in everyday UI development.

2. Tasks Completed

- Flutter project created and configured in Visual Studio Code.
- Android emulator configured and used to run the application.
- Flutter project folder structure understood and organized.
- Splash Screen designed.
- Login Screen designed with email and password fields.
- Sign Up Screen designed with registration fields.
- Home Screen designed as a UI-only dashboard.
- Navigation between the main screens implemented.

3. Topics Covered

Flutter Installation	Project Structure
Scaffold	AppBar
Text	Icon
TextField	ElevatedButton
Row & Column	Container

4. Project Structure

The application separates the main screens into individual Dart files inside the lib folder. This keeps the project organized and makes each screen easier to maintain.

Figure 1 — Flutter project structure in Visual Studio Code.

5. Login Screen

The Login Screen provides a professional starting point for the user. It includes an email field, password field, password visibility control, a Forgot Password option, a Login button, and a Sign Up navigation option.

Figure 2 — Login Screen running on the Android emulator.

6. Home Screen

The Home Screen demonstrates the use of AppBar, Container, Row, Column, Icon and text-based UI components. It contains a welcome card, Quick Actions, task/profile/course/settings cards, a Today section, and bottom navigation.

Figure 3 — Home Screen UI running on the Android emulator.

7. Sign Up Screen

The Sign Up screen was implemented as part of the application flow. It contains fields for full name, email, password and password confirmation, together with visibility controls and a Create Account button.

8. Running the Application

The project was successfully launched from the VS Code terminal using the Flutter CLI. The build process completed successfully, the APK was generated, installed on the Android emulator, and the application synchronized successfully with the device.

Command used: flutter run

9. GitHub Repository

The completed project is available in the GitHub repository below:

<https://github.com/29mayalinakhan2007-hue/my.flutter.project>

10. Conclusion

This task provided practical experience with Flutter project setup, project organization, basic widgets, UI design, screen navigation, and running a Flutter application on an Android emulator. The completed screens form a strong foundation for developing more advanced Flutter applications in future tasks.
